Multiclet announces the production launch of the Digital Guardian MULTICLET Key_P1 – a multi-function data protection device for PCs and storage devices.

The modern world is like a global data field and the basic means for interacting with it are personal computers and electronic devices.

Users are now faced with the problem of protecting themselves from unsanctioned access, loss of data and possible virus/spyware attacks at the device level. Both private individuals and companies need a successful business to protect their PCs which is directly dependent on how well it can maintain the confidentiality of their know-how and information.

MULTICLET has the solution!

The company presents a Digital Guardian, the MULTICLET Key_P1, developed based on multicellular processors with universal non Von Neumann architecture, which secures data against loss, theft and unsanctioned access. This is the company's first product for the B2C sector.

What is the MULTICLET Key_P1 and what can it do?

The MULTICLET Key_P1 is a multi-function data protection device for PCs and storage with three connectors: USB – plug and socket and SD card slot.

The MULTICLET Key_P1 can do the following:

- Exchange encrypted messages and files between users (the files can be encrypted without storage);

- Secure passwords and PIN numbers and protect other personal information from fraudsters and one's own forgetfulness;

- Restore information even in the event of the loss of the device and storage.

It offers more than 15 functions, the list of which shall continue to grow in the future.

MULTICLET Key_P1 may form a single key, which is useful, for example, for the exchange of

Phoca PDF

information between employees who are on business trips and the head office.

Modifying of storage (spying), introduced via keyboards and the unsanctioned collection of your information, are no longer a concern - the MULTICLET Key_P1 does not allow them to work.

The MULTICLET Key_P1 is intended to work with two types of storage drives - USB storage and SD cards. It is possible to extend the functionality of your device using the various adapters that are available.

The device will be available with two OS versions:

- Home

- Professional

The professional version includes the possibility to create hierarchical access to company information, in which, for example, the CEO has access to all files and on accessing specific information, may make this available to departments or individual employees, as required.

The product will be available exclusively on kickstarter.com until 25 April 2014
